Roman Oglan	110106040	API Integration & Back End Logic
Taha Hammoud	110131196	UI Design
Stefan Bratic	110136289	Requirements Engineering, Testing & Documentation

Problem Domain and Motivation

Libraires have a wide variety of information they must manage, including books, authors, borrowing, returns, etc. Managing this information is a vital part of an efficient library. Without managing this information, it would cause poor records, inaccurate inventory, unable to track borrowed books, etc. Managing a library system would solve problems like the ones above by storing all the information into a database. This allows the library to check inventory, track borrowing transactions, and check book availability.

The motivation for the library management system is to create a system which would efficiently manage the operations of a library. We can efficiently manage it by having it more organized, accurate, and overall faster. We will reduce manual record keeping and have faster access. By doing that it will make the experience of staff and users more enjoyable.

Target Users

The target users for our bookstore database would include the stores' customers, staff, and inventory managers. Our library system will be designed to make searching for books in stock, reading descriptions, and viewing prices very accessible for store customers to navigate. Meanwhile, the staff at this bookstore should be able to swiftly scan and look up ISBN barcodes, price-check, and get real-time inventory on books throughout their shift. Finally, for the bookstores inventory managers, this system will

help track stock levels and review what genres are selling so they can maintain their supply.

System Description

Our system aims to be a dependable, clean, and compact online bookstore/library system, that'll make it feel natural for users to search, borrow and purchase books. Users will be able to search by author, ISBN, title, price, and other filters, like genre and format. After selecting or clicking a title, the user enters the book details page. On this page, they will see details, reviews, and ratings from trusted sources, as well as a Netflix-style "you may also like" recommendations tab. Staff will also be able to use the system in order to update inventory, adjust pricing, apply discounts, and view the most purchased or checked out books for future orders.
